CODEAXIS · ROUND 3 PRODUCT SUBMISSION

BrandGuard AI

Clearer, safer marketing copy — with people in control.

N

THE PRODUCT

A pre-publication review workspace that sends draft copy to a configured Gemini or OpenAI model for risk findings and a suggested rewrite. Reviewers decide what gets approved.

THE WORKFLOW

Write or upload > review with AI > discuss and assign > approve or request changes > optionally save an unpublished WordPress draft.

Prepared by Team NEXORA

What it does

BrandGuard AI helps a marketing team catch risky wording before publication, explain the concerns and keep a human reviewer in the approval loop.

Core capabilities

AI copy review	Calls Gemini or OpenAI from the Node server; the browser never receives provider API keys.
Clear findings	Shows risk, matched phrases, reasons and a suggested rewrite. AI findings are decision support, not verified facts.
Team access	Owner, reviewer and editor accounts use separate sign-ins. Server-side role checks control approvals and account creation.
Review history	Saves submitted reviews, decisions, assignments and comments in a protected workspace store.
WordPress drafts	Can create an unpublished WordPress post using the site REST API and an Application Password. It never publishes.
Draft tools	Supports text/Markdown upload, counts, draft editing and a downloadable review report.

How it is built

Browser interface	Node.js server	Connected services
HTML · CSS · JavaScript Same-origin API calls	Authentication · permissions Gemini/OpenAI + WordPress connectors JSON workspace file	Gemini or OpenAI REST API WordPress REST API Unpublished post creation

Credentials: provider keys and WordPress application credentials are stored server-side and excluded from the project source. Hosted deployments must use the host's private environment settings.

Round 2 commitments and Round 3 status

1 · Context-aware, guideline-grounded AI review

Gemini and OpenAI review and rewrite integrations are implemented. Gemini free-tier use requires the owner key; the linked OpenAI account currently has zero API credits. Retrieval of approved company policy and independent evidence verification are not included; reviewers still check claims.

2 · Shared team workflow

Sign-in, salted password hashes, expiring HttpOnly sessions and server-enforced owner/reviewer/editor permissions are implemented. Multi-factor authentication and account recovery are future work.

3 · CMS pre-publication integration

WordPress integration can create unpublished drafts when configured. It does not publish and does not support other CMS providers yet.

Testing status

Local syntax and security checks passed. OpenAI reached the API but the account returned a no-credits error. Gemini live review needs the owner's Gemini API key. WordPress live draft creation remains unverified.

Next steps

• Add a Gemini free-tier API key and verify review results with representative sample copy; OpenAI remains available when API credits exist.

• Connect a WordPress test site and confirm new content appears as an unpublished draft.

• For production use, move workspace records to a managed database; add MFA, account recovery, backups, monitoring and formal security review.

HONEST STATUS: Gemini and OpenAI connectors are in the build. Gemini requires an eligible free-tier key and quota; OpenAI requires available API credits. AI does not replace legal review or prove claims.
